

dormakaba TouchGo
Opens doors with just a
touch

More convenience
at the door

Tired of looking for keys?

The electronic master key system with TouchGo function frees you from looking for your keys. Just touch the door handle and the lock recognizes if you have valid access rights. Whether for private or commercial use, as a stand-alone or online solution, TouchGo is perfect for everyone who values convenience as well as security.

It is raining, your hands are full with shopping bags, you have your mail under your arm and you are standing in front of a locked door. Naturally, your key is at the bottom of your bag and you know that you will not get into the house without getting wet or straining yourself in the process.

You have arrived at the office and it is only a few minutes before an important team meeting. You quickly put your smartphone on top of your files, rush down the stairs over to the other building.

But oh no, your badge is tucked away in the inner pocket of your jacket and it quickly becomes clear that your huge pile in your arms will not survive any sudden moves.

What would it be worth to you if someone would unlock the door for you in these situations?

We have solved that for you: TouchGo opens doors with just a touch

It was a dream of the future - now it is reality: doors can be opened without having to search for keys hidden in your bag.

The new TouchGo products are based on RCID technology which have been developed by us. All you need to do is to touch the metal receiving electrode – for example a door handle – to activate verification of your access right. It doesn't matter where the TouchGo transponder is – in your pocket, jacket or on your belt.

Your advantages: you no longer have to search for your key or badge, your hands are free and you still have the proven high security standard of one of our master key systems.

Our business customers will be pleased to hear that the benefits of TouchGo are available for most dormakaba systems.

RCID makes it possible

RCID technology (resistive capacitive identification) was developed by dormakaba. It is based on the use of the natural electrostatic charge of the human body and is therefore used selectively. The avoidance of radiation during the transmission of information offers great advantages in the area of security.

As secure as it is convenient: TouchGo for your home

TouchGo is made for anyone who expects security as well as convenience from their master key system. Doors can be opened comfortably by simply touching the door handle. You enjoy the flexibility of an electronic lock and keep the useful aspects of a secure mechanical master key system. Lost access media can be simply revoked and new ones easily programmed.

Basic equipment

TouchGo for residential use includes the door furniture (also available in protection grade ES1), the user key fobs and the master transponder for programming.

TouchGo can be installed on standard locks so that nothing stands in the way for an easy installation and with it, your convenience at the door.

Programming

Programming TouchGo is very easy. Touching the door handle with the programming master medium starts the programming process. Now all desired access media can be programmed one after the other by touching the handle with the corresponding user media in succession. The process is finalized as soon as you touch the door handle with the master medium.

Security

The highest priority of any master key system is security. The same is true for the TouchGo but to a higher degree, because any access medium that is lost can be revoked quickly. This avoids both security gaps as well as the cost-intensive replacement of an entire master key system. Along with the new convenience, this is another important advantage of the electronic access system.

through the door lever.

Full integration: TouchGo for your working environment

A good combination for offices: RFID, CardLink and TouchGo. The c-lever pro with TouchGo function combines the advantages of a central administration with great convenience for the user - and it can be integrated into most dormakaba systems. You can configure your master key system as usual with the administration software and your employees will have their hands free for more important matters.

Basic equipment

The c-lever pro with TouchGo function comes with additional electronics, integrating the TouchGo features into the door furniture. All you need is a TouchGo access medium to benefit from the advantages of keyless entry. The RFID functions remain valid and at the same time, you profit from the convenience of TouchGo.

Programming

All settings can be made as usual and according to your system, via the programming device or directly on your PC. An automatic alignment in the electronic door furniture synchronizes the RFID card with the TouchGo function, and the door handle is ready for use.

Security

In terms of security hardly any wishes remain unfulfilled. The c-lever pro with TouchGo and RFID function can be seamlessly integrated into the existing dormakaba security concept. Your system remains as secure as it was before: TouchGo is a convenience option that does not affect your security concept, but it does ensure your investment protection: if you lose your badge, it can be revoked and a new one can be programmed. The combinability of our products among one another additionally ensures the protection of your investment.
